

TITLE

**DIGITAL VIDEO CASSETTE RECORDER FOR PREVENTING PICTURE
DISTORTION DURING SEARCH AND METHOD FOR PROCESSING
PICTURE USING THE SAME**

CLAIM OF PRIORITY

This application makes reference to, incorporates the same herein, and claims all benefits accruing under 35 U.S.C. §119 from an application for *DIGITAL VIDEO CASSETTE RECORDER FOR PREVENTING PICTURE DISTORTION DURING SEARCH AND METHOD FOR PROCESSING PICTURE USING THE SAME* earlier filed in the Korean Industrial Property Office on the nd of July 1997 and there duly assigned Serial No. 30653/1997.

BACKGROUND OF THE INVENTION

Technical Field

The present invention relates to a digital video cassette recorder, and more particularly, to a digital video cassette recorder for preventing picture distortion during search, and a method for processing a picture using the same.

Related Art

Analog video cassette recorders adopt a consecutive recording method, but digital video cassette recorders adopt a non-consecutive recording method. Thus, the digital video cassette recorder displays a non-recognizable image, (*i.e.*, an image signal whose image pixels are not

1 arranged) on its screen, while image data recorded in a recording medium is searched.

2 The digital video cassette recorder has a search mode and a normal reproduction mode. The
3 digital video cassette recorder cannot reproduce a picture having the plurality of a normal picture in
4 the search mode, since it scans more tracks at a time than in the normal reproduction mode.
5 Accordingly, image data which is difficult for a human to recognize is displayed during the search
6 mode.

7 The following patents are considered to be representative of the prior art, and are burdened
8 by the disadvantages set forth herein: U.S. Patent No. 5,583,936 to Wonfor *et al.*, entitled *Video*
9 *Copy Protection Process Enhancement To Introduce Horizontal And Vertical Picture Distortions*,
10 U.S. Patent No. 5,452,096 to Ito, entitled *Recording/Reproducing Apparatus Wherein The Same*
11 *Frame Of A Video Signal Is Repeatedly Read Out Of A Memory To Produce Special Effects*, U.S.
12 Patent No. 5,179,479 to Ahn, entitled *Method Of High Speed Searching For A Desired Tape Portion*
13 *In A Digital Audio Tape Recorder*, U.S. Patent No. 5,748,332 to Lee, entitled *Video Repeat*
14 *Reproduction Method And Apparatus*, U.S. Patent No. 5,233,485 to Yang, entitled *Index Search*
15 *Method And system Thereof For Digital Video Cassette Tape Recorder*, U.S. Patent No. 5,406,381
16 to Han, entitled *Character-Displayed Index Search System And Method*, U.S. Patent No. 5,510,889
17 to Kim, entitled *Method Of Multi-Speed Recording-Reproducing A Video Signal I Digital Video*
18 *Cassette Recorder*, U.S. Patent No. 5,523,896 to Park, entitled *Variable Speed Reproducing*
19 *Apparatus For A Digital Video Cassette Recorder*, U.S. Patent No. 5,528,382 to Kato *et al.*, entitled
20 *Reproduction Apparatus For Video Signals Accompanied By Control Information*, U.S. Patent No.

1 5,587,789 to Lee *et al.*, entitled *Apparatus And Method For Controlling Recording And*
2 *Reproduction In Digital Video Cassette Tape Recorder*, U.S. Patent No. 5,479,265 to Kim *et al.*,
3 entitled *Video Data Recording Apparatus For Digital Video Cassette Recorder*, U.S. Patent No.
4 5,418,623 to Park, entitled *Method Of Recording And Reproducing A Video Signal With Improved*
5 *Quality During Variable Speed Operation*, and U.S. Patent No. 5,675,693 to Kagoshima, entitled
6 *Video Signal Reproducing Apparatus With Plural Search Functions*.

7 SUMMARY OF THE INVENTION

8 To solve the above problem, an object of the present invention is to provide a digital video
9 cassette recorder which prevents picture distortion during search by scanning some frames in a
10 normal mode and displaying the scanned frames on a screen before execution of a search operation,
11 and by simultaneously controlling the search operation to be executed in a search mode.

12 It is another object of the present invention to provide a picture processing method using the
13 technique of the above digital video cassette recorder.

14 To accomplish the first object, there is provided a digital video cassette recorder which
15 includes: a search command applier; a reproduction unit for outputting data reproduced at a normal
16 mode according to a fourth control signal; a switch for selecting reproduced data output by the
17 reproduction unit for a predetermined time according to a first control signal; a memory for storing
18 the image data which is reproduced in the normal mode and output from the switch; a display for
19 displaying the image data stored in the memory according to a second control signal; a capstan motor
20 for converting the traveling speed of a tape depending on a normal reproduction mode or search

1 mode according to a third control signal; and a controller for outputting the fourth, first, second and
2 third control signals for controlling the reproduction unit, the switch, the display and the capstan
3 motor, respectively, when a search command is applied from the search command applier. The
4 predetermined time mentioned above is the time for normally reproducing a predetermined number
5 of frames.

6 To accomplish the second object, there is provided a method of processing a screen picture
7 during search, comprising the steps of: (a) applying a search command; (b) reproducing a
8 predetermined number of frames in a normal mode; (c) storing image data reproduced in the normal
9 mode; (d) executing search operation simultaneously while displaying the stored image data; (e)
10 preventing reproduced data from being displayed and displaying searched data instead if desired
11 image data is searched; and (f) determining whether display of the searched data is completed, and
12 whether the search operation will continue. If the display of the searched data is completed and a
13 new search is to continue in step (f), the steps (d) to (f) are repeated. Also, if the display of the
14 searched data is completed and a new search is to continue in step (f), the steps (b) to (f) are
15 repeated. In addition, the searching step (d) comprises the steps of: converting a traveling speed of
16 a tape to a traveling speed used during the search; and preventing data reproduced during the search
17 from being displayed.

18 BRIEF DESCRIPTION OF THE DRAWINGS

19 A more complete appreciation of the invention, and many of the attendant advantages
20 thereof, will be readily apparent as the same becomes better understood by reference to the following

1 detailed description when considered in conjunction with the accompanying drawings in which like
2 reference symbols indicate the same or similar components, wherein:

3 FIG. 1 is a block diagram showing the configuration of a digital video cassette recorder
4 according to the present invention;

5 FIG. 2 is a detailed block diagram of the reproducing unit shown in FIG. 1;

6 FIG. 3 is a flowchart illustrating a method of processing a picture during search according
7 to a first embodiment of the present invention; and

8 FIG. 4 is a flowchart illustrating a method of processing a picture during search according
9 to a second embodiment of the present invention.

10 DETAILED DESCRIPTION OF THE INVENTION

11 Referring to FIG. 1, a digital video cassette recorder includes a reproduction unit 100, a
12 switch 102, a memory 104, a display 106, a capstan motor 108, a controller 110 and a search
13 command applier 112.

14 Referring to FIG. 2, the reproduction unit 100 includes a reproduction head 10, an amplifier
15 12, an equalizer 14, an inverse discrete cosine transformer (IDCT) unit 16, an error corrector 18 and
16 an extension unit 20. Unit 100 outputs reproduced data for a predetermined time according to a
17 fourth control signal output by the controller 110.

18 The switch 102 selects the reproduced data output from the reproduction unit 100 for a
19 predetermined time according to a first control signal output by the controller 110. That is, the
20 switch 102 selects the reproduced data if the first control signal is a high level, and interrupts

1 selection of the reproduced data if the first control signal is a low level.

2 The memory 104 stores image data which is reproduced in a normal reproduction mode and
3 output from the switch 102.

4 The display 106 displays the image data stored in the memory 104 according to a second
5 control signal output by the controller 110. That is, the display 106 displays the image data stored
6 in the memory 104 if the second control signal is a high level, and displays searched image data if
7 the second control signal is a low level.

8 The capstan motor 108 determines the traveling speed of the tape depending on a normal
9 reproduction mode or search mode according to a third control signal output by the controller 110.
10 That is, if the third control signal is a high level, the capstan motor 108 spins at a speed appropriate
11 for the normal reproduction mode. If the third control signal is a low level, the capstan motor 108
12 spins at a speed appropriate for the search mode.

13 The controller 110 provides the fourth, first, second and third control signals for controlling
14 the reproduction unit 100, the switch 102, the display 106 and the capstan motor 108, respectively.

15 That is, the controller 110 controls the reproduction unit 100 and the capstan motor 108 to
16 output normal reproduced data for a predetermined time when a search command is applied from
17 the search command applier 112. The controller 110 controls the switch 102 to select reproduced
18 data output by the reproduction unit 100. The term "predetermined time" denotes a period during
19 which reproduced data of two or three frames can be output. The controller 110 controls the display
20 106 to display the reproduced data read from the memory 104, and simultaneously controls the
21 capstan motor 108 to rotate the tape at a search mode speed.

1 The operation of the device shown in FIG. 1 will now be described. After a search command
2 is provided by the search command applier 112, the controller 110 controls the capstan motor 108
3 to maintain the traveling speed at a value at which normal reproduction is conducted, and controller
4 110 controls the reproduction unit 100 to output normal reproduced data by operating some frames
5 (e.g., two or three frames) at the normal reproduction mode. Also, the controller 110 controls the
6 switch 102 to select data reproduced by the reproduction unit 100. At this time, the memory 104
7 stores the reproduced data output via the switch 102.

8 The controller 110 also controls the display 106 to display the normal reproduced data stored
9 in the memory 104, controls the switch 102 to connect or disconnect the normal reproduced data,
10 and controls the capstan motor 108 to rotate a tape at a predetermined search mode speed.

11 When the search command is provided, image data having some frames reproduced during
12 the normal reproduction mode is continuously displayed on the display 106, and a search operation
13 is conducted simultaneously so that the user does not see distorted picture during the search. When
14 desired searched data is detected, the searched image data is displayed on the display 106.

15 In the above-described embodiment, extended reproduced data is selected by the switch 102
16 for a predetermined time. After the predetermined time elapses, the switch 102 interrupts the
17 selection of the reproduced data. However, the selection and non-selection of a reproduced signal
18 using the switch 102 can be performed on reproduced data output from other blocks of the
19 reproduction unit 100. The memory 104 can be an error-correction memory (not shown) or a de-
20 shuffling memory (not shown).

21 A picture displayed on the display 106 during a search can be updated by performing

1 selection or non-selection via the switch 102 in units of a predetermined number of reference frames.

2 FIG. 3 is a flowchart illustrating a method for processing a screen picture during search
3 according to a first embodiment of the present invention.

4 In the method for processing a screen picture during a search as shown in FIG. 3, data
5 reproduced in the normal reproduction mode when the search begins is stored only one time, and the
6 stored normal reproduced data is continuously displayed during the search. After searched data is
7 detected, the reproduced data being displayed is converted to the searched data, and the searched data
8 is then displayed. Accordingly, the image data reproduced in the normal mode upon the initiation
9 of the search continues to be displayed until the search is ended.

10 Hereinbelow, the flowchart shown in FIG. 3 will be described in more detail.

11 A search command is provided in step 300.

12 A predetermined number of frames is reproduced in a normal mode in step 302.

13 Image data reproduced in the normal mode is stored in a predetermined memory in step 304.

14 The stored image data is displayed on a display in step 306, and the search is conducted in
15 step 308. In order to execute the search, the capstan motor 108 (FIG. 1) spins at a search speed, and
16 data reproduced during the search is prevented from being displayed on the display 106.

17 A determination of whether desired image data is detected during the search is made in step
18 310 (FIG. 3). If the desired image data is not detected, step 308 is repeated; if the desired image data
19 is detected, the reproduced data being displayed is eliminated and the searched data is displayed
20 instead in step 312.

21 A determination of whether display of the searched data is completed is made in step 314.

1 If display of the searched data is finished a determination is made in step 316 as to whether the
2 search is to continue. If it is determined that the search is not to continue, the search is ended. If it
3 is determined that the search continues, the stored image data is displayed in step 306, and steps 308
4 thru 316 are performed.

5 FIG. 4 is a flowchart illustrating a method for processing a screen picture during search
6 according to a second embodiment of the present invention.

7 In the method of processing a screen during search as shown in FIG. 4, whenever the search
8 continues, data reproduced in a normal mode is stored, and then the stored normal reproduced data
9 is displayed during the search. Thus, whenever the search resumes, the normal reproduced image
10 data is changed and displayed.

11 Now, the method shown in FIG. 4 will be described in more detail as follows.

12 A search command is provided in step 400.

13 A predetermined number of frames is reproduced in a normal mode in step 402.

14 Image data reproduced in the normal mode is stored in a predetermined memory in step 404.

15 The stored image data is displayed on a display in step 406, and the search is conducted in
16 step 408. In order to execute the search, the capstan motor 108 (FIG. 1) spins at a search speed, and
17 data reproduced during the search is prevented from being displayed on the display 106.

18 A determination as to whether desired image data is detected during search is made in step
19 410. If the desired image data is not detected, the step 408 is repeated; and if the desired image data
20 is detected, the reproduced data being displayed is eliminated and the searched data is displayed
21 instead in step 412.

1 A determination as to whether display of the searched data is completed is made in step 414.

2 If display of the searched data is finished, a determination is made in step 414 as to whether the
3 search will continue. If it is determined that the search will no longer continue, the search is ended.
4 If it is determined that the search will continue, steps 402 thru 416 are repeated.

5 According to the present invention described above, screen picture distortion occurring on
6 the display during the search can be prevented.

7 It should be understood that the present invention is not limited to the particular embodiment
8 disclosed herein as the best mode contemplated for carrying out the present invention, but rather that
9 the present invention is not limited to the specific embodiments described in this specification except
10 as defined in the appended claims.
